Characterization

Nuclear Magnetic Resonance (NMR) Spectroscopy

The synthesized structures were confirmed via NMR measurements on a Bruker Ascend 400 spectrometer with 400 MHz for hydrogen nuclei and 100 MHz for carbon nuclei. Samples were dissolved in CDCl₃, DMSO-d₆ or D₂O. The δ-scale was referenced with tetramethylsilane (δ = 0.00) as internal standard. Abbreviations used below in the description of the materials syntheses include singlet (s), broad singlet (bs), doublet (d), triplet (t), quartet (q), broad multiplet (bm), and unresolved multiplet (m). The 2D NOESY (nuclear Overhauser enhancement spectroscopy) spectrum was measured on a 600 MHz Bruker Avance III
spectrometer equipped with a $^1$H, $^{13}$C, $^{15}$N – TCI inversely detecting cryoprobe at 25 °C (298 K). The 90° proton pulse length was determined to be 8.37 µs. 24 number of scans with 4096 complex data points were recorded for each of the 256 increments with 16 dummy scans per experiment, leading to an overall experiment time of 16 h 49 min 8 sec. Residual protonated water was suppressed using a cw-presaturation sequence with a length of 4 s and an RF amplitude of 25 Hz. Zero filling and linear prediction to a total of 1024 x 1024 complex data points was performed. Processing was achieved using Topspin 3.2. The mixing time was set to 300 µs and the concentration of the sample was 50 mg mL$^{-1}$ in D$_2$O.

**Size Exclusion Chromatography (SEC)**

SEC measurements were performed with N,N-dimethylacetamide (DMAC) as eluent containing 0.03 wt% LiBr on a Polymer Laboratories PL-GPC 50 Plus Integrated System, comprising an autosampler, a PLgel 5 µm bead-size guard column (50 × 7.5 mm) followed by three PLgel 5 µm MixedC columns (300 × 7.5 mm), and a differential refractive index detector at 50 °C with a flow rate of 1.0 mL min$^{-1}$. The SEC system was calibrated against linear poly(styrene) standards with molecular weights ranging from 160 to 6·10$^6$ g mol$^{-1}$. Calculations for the molecular weight of poly(DMAAm)-$^t$BuBnPE and poly(DEAAm)-Mal were carried out according to a poly(styrene) calibration, i.e. $K = 14.1·10^{-5}$ dL g$^{-1}$, $\alpha = 0.70$ (PS). The molecular weight dispersity is abbreviated as $D$.

**Electrospray Ionization-Mass Spectrometry (ESI-MS)**

Mass spectra were recorded on a Q Exactive (Orbitrap) mass spectrometer (Thermo Fisher Scientific, San Jose, CA, USA) equipped with an HESI II probe. The instrument was calibrated in the m/z range 74-1822 using premixed calibration solutions (Thermo Scientific). A constant spray voltage of 4.7 kV and a dimensionless sheath gas of 5 were applied. The capillary temperature and the S-lens RF level were set to 320 °C and 62.0, respectively. The samples were dissolved with a concentration of 0.05 mg·mL$^{-1}$ in a mixture of THF and MeOH (3:2) containing 100 µmol of sodium trifluoroacetate (NaTFA) and infused with a flow of 5 µL·min$^{-1}$.

**Dynamic Light Scattering (DLS)**

Sample solutions were prepared by dissolving the samples in Milli Q water at a constant concentration of 0.06 mmol L$^{-1}$. The solutions were filtered via a 0.2 µm syringe filter to remove dust particles. Before the measurement the solution of the supramolecular triblock copolymer was left for 30 min, so the equilibrium between β-CD and tert-butyl phenyl units
could re-establish. Hydrodynamic diameters where determined via dynamic light scattering (Nicomp 380 DLS spectrometer from Particle Sizing Systems, Santa Barbara, USA, laser diode: 90 mW, 658 nm). Measurements were performed in automatic mode and evaluated with a standard Gaussian and an advanced evaluation method, the latter proceeding via an inverse Laplace algorithm to analyze for multimodal distributions. The values provided in the study are the number-weighted average values as calculated in the NICOMP evaluation. All measurements were determined at an angle of 90° to the incident beam. The associated auto-correlation functions can be found in Figure S29 to Figure S42.

**UV-vis Spectrometer**

UV-Vis spectra were measured on a Cary 300 Bio UV-Vis spectrophotometer (Varian) at either 25 °C or 10 °C, depending on the sample.

The comparison of the two spectra shows the successful deprotection of the maleimide via the disappearance of the furan protection group resonances at 6.51 ppm (a) and 5.26 ppm (b). The appearance of the maleimide double bond resonances, in the spectrum on the bottom, at 6.71 ppm (a) also verifies the complete deprotection of 5a.

**Scheme S3.** Synthetic strategy for the alkyne-functionalized polymer blocks: poly(NiPAAm)-alkyne 7iia and poly(DMAAm)-alkyne 7iib.

**Synthesis of alkyne functionalized polymer poly(NiPAAm) (7iia):** In a Schlenk-tube NiPAAm (5.00 g, 44.19 mmol, 87.00 eq., 1921.10 mmol L⁻¹), AIBN (0.008 g, 0.05 mmol, 0.1 eq., 2.11 mmol L⁻¹) and prop-2-yn-1-yl 2-(((ethylthio)carbonothioyl)thio)-2-methylpropanoate 7i (0.135 g, 0.51 mmol, 1.0 eq., 22.08 mmol L⁻¹) were dissolved in DMF (23 mL) and equipped with a stirring bar. Via three freeze-pump-thaw cycles, oxygen was removed from the reaction mixture and the tube was placed in a preheated oil bath at 60 °C. After 2.5 h the reaction was quenched by cooling with liquid nitrogen and subsequently dialyzed against deionized water (SpectraPor3 membrane (MWCO = 1000 Da)) for three days at 4 °C in the fridge. The water was removed by lyophilization and the polymer was obtained as a yellow solid (1.03 g, $M_n$ theo = 10500 g mol⁻¹, $M_n$ SEC (DMAC) = 8800 g mol⁻¹, $D = 1.1$).

Chain extension poly(NiPAAm)-alkyne 7iic: Poly(NiPAAm)-alkyne 7iia ($M_n$ SEC (DMAC) = 8800 g mol$^{-1}$, 1.00 g, 0.11 mmol, 1.0 eq., 2.84 mmol L$^{-1}$), AIBN (0.004 g, 0.02 mmol, 0.21 eq., 0.61 mmol L$^{-1}$) and HOEAAm (2.00 g, 17.37 mmol, 152.87 eq., 434.29 mmol L$^{-1}$) were placed in a Schlenk-tube and dissolved in DMF (40 mL). Oxygen was removed from the reaction mixture via three freeze-pump-thaw cycles and the tube was subsequently placed in an oil bath at 60 °C. The solution was stirred at 60 °C for 2.5 h and quenched by cooling with liquid nitrogen. The mixture was dialyzed against deionized water for three days with a SpectraPor3 membrane (MWCO = 1000 Da). Synthesis of hydroxyl terminated, alkyne functionalized poly(NiPAAm) (alkyne-poly(NiPAAm)-OH) (7iiia): In a round bottom flask freshly distilled THF (52 mL) was heated to 60 °C in an oil bath. Under vigorous stirring AIBN (340 mg, 2.07 mmol, 36.00 eq., 39.81 mmol L\(^{-1}\)) was added to the flask and stirred for 5 min. Subsequently, poly(NiPAAm)-alkyne 7iiia \( (M_n\text{ (DMAC)} = 8800 \text{ g mol}\^{-1}, 500 \text{ mg}, 0.06 \text{ mmol, } 1.00 \text{ eq.}, 1.96 \text{ mmol L}\^{-1}) \) was added to the mixture which turned light yellow. The solution was stirred until complete discoloration (indication of full conversion) under ambient oxygen. To quench the generated peroxides, the temperature was reduced to 40 °C and ascorbic acid (108 mg, 0.61 mmol, 6.0 eq., 5.68 mmol L\(^{-1}\)) was added. Peroxide dipsticks (Quantofix Peroxid 100, 1 – 100 mg L\(^{-1}\) \( \text{H}_2\text{O}_2 \)) were employed to check for the presence of peroxides. The solvent was reduced in vacuo after the removal of the peroxides and the residue was dialyzed against deionized water for three days, employing a SpectraPor3 membrane (MWCO = 1000 Da). The product was obtained as white powder (414.00 mg, \( M_n\text{ sec (DMAC)} = 8900 \text{ g mol}\^{-1}, D = 1.1 \)).

**Theoretical molecular weight calculations**

Theoretical molecular weights were calculated with the equation below:

\[
M_{n, \text{theo}} = \left( \frac{[\text{monomer}]}{[\text{CTA}]_0} \times M_{\text{monomer}} \times U \right) + M_{\text{CTA}}
\]
Formation of the diblock copolymer via the photo-induced Diels-Alder reaction: poly(DEAAm)-Mal (20.00 mg, 0.0014 mmol, 1.0 eq. based on $M_n^{\text{SEC}} = 5600$ g mol$^{-1}$) and poly(DMAAm)-rBuBnPE (10.43 mg, 0.0035 mmol, 0.4 eq. based on $M_n^{\text{SEC}} = 7300$ g mol$^{-1}$) were dissolved in MeCN (6 mL) and aliquoted into headspace vials. The vials were crimped airtight with SBR seals with PTFE inlet and oxygen was removed from the solution by purging with nitrogen for 15 min. Subsequently, the vial was placed in a custom-built photoreactor and irradiated at a wavelength of 320 nm for 40 min. The solvent was removed in vacuo and the residue measured directly in the SEC (30.00 mg, $M_n^{\text{SEC}}$ (DMAC) = 10000 g mol$^{-1}$).

Figure S29. ESI-MS spectrum of poly(DMAAm)−b-poly(DEAAm) 6 and a magnification of the spectrum (below). The spectrum shows the double, triple and quadruple charged polymer chains of 6 ionized with Na\textsuperscript{+}. We note that \( \Delta m/z \) is very high and outside the resolution of our Orbitrap mass analyzer. The analyzed structure is a highly complex diblock copolymer and we assume that during ionization, for example, proton abstraction or similar processes occur. We also note that the assigned peaks do not correspond to the single polymer blocks (4 and 5). On balance all analytical evidence (SEC, NMR and DLS) clearly points to the formation of the diblock copolymer 6 and that the sub-Da deviation occurs during the ionization process.

Figure S42. 2D NOESY NMR spectrum of the supramolecular tetrablock copolymer poly(NiPAAm)-b-poly(HOEAAm)-b-poly(DMAAm)-b-poly(DEAAn) 8c in D$_2$O at 25 °C. The cross-correlation peaks evidencing the close proximity of the inner protons of β-CD (3.10 ppm, 3.37 ppm and 3.57 ppm) and the tert-butyl benzyl protons (6.90 ppm and 7.10 ppm) are circled in the spectrum.
